

## Your Choice of Designer Faucets

✓ Cartridges are quick and easy to replace ✓ Stylish separate tap for your pure filtered drinking water

### Quattro Alkaline Premium Drinking Water System

The Quattro Gold alkalising filter cartridges can be added to your pre-built water filtration systems. They work just as well in-line with an existing system as they can work on their own.

These are different to other types of filters, as their focus is not just on removing 'impurities' from the water (sometimes traditional water filters also remove beneficial mineral and elements as well as all the bad stuff). At a simple level they do this quite well, but what they specialise in, is to change the chemical acidity of the water to make it more alkaline.

### HOW IT WORKS

At a molecular level, the filter emits far-infrared rays. This induces shorter cluster chains in the water molecules, which – when drunk – increases the bio-available response and oxygen absorption in the body, providing you with enhanced water that is alkaline, re-mineralised, energised, has low ORP and one of the best absorption rates possible.

This cutting edge filter is the result of much research and experience in the clean water industry. Normally installed under the kitchen sink with a disk tap and carafe-filler spout mounted into the sink (all parts and accessories are included), the system provides an ideal water filter for home or office.

# Quattro Alkaline Filter

PH is a term you'll hear a lot when discussing alkalising water filters. It is a scientific scale used to measure the acidity/alkalinity of a liquid. Pure water is pH neutral. It has a pH level of 7 (on a scale of 0-14). With a pH higher than 7 the liquids become more alkaline, and below 7 the liquids become more acidic. For example, a lemon – being very acidic – has a pH of 2, and ammonia & many cleaning products have an extremely high pH of 11-13. Slightly acidic drinking water might have a pH of 6.

Alkaline filters will purify your water & increase the pH level towards neutral, making it less acidic. This chemical transformation improves antioxidantising and oxygenating qualities. You can taste the difference. Ph neutral water tastes 'fresher'. It is more satisfying to drink as it is relatively Oxygen rich, and has an equally lower relative amount of Hydrogen.

**STAGE 1**

Sediment filter cartridge for the removal of dirt rust and particles

**STAGE 2**

The super block carbon cartridge removes 99.9% of metals

**STAGE 3**

The coconut shell carbon ensures that your drinking water has an outstanding taste
